

SEO, AAIO, and AEO Audit for pinpointaccountingservice.com

Executive summary

This audit finds that **pinpointaccountingservice.com** does not appear to be suffering from a single **catastrophic technical SEO failure**. Instead, the site's low organic traffic is best explained by a stack of smaller but compounding issues: **thin and near-duplicate Bangkok location pages, inconsistent multilingual implementation, weak off-site authority and local citation depth, weak SERP snippet differentiation in Thai commercial results, and limited public trust/credential signals compared with Thai competitors**. At the same time, the site already has several real strengths for SEO and AI-surface discoverability: answer-first sections, FAQs, an entity-verification page, official-source linking, a shallow architecture, and fresh content covering clear commercial topics. ¹

The **most plausible public explanation for “Thailand weak, outside Thailand growing”** is that the site is more likely to attract impressions from **English and foreign-founder informational intent** than from **Thai local-commercial intent**. Publicly indexed pages include a dedicated English homepage and a detailed English guide for foreign founders, while many additional English alternates are discoverable as `?lang=en` URLs. By contrast, the Thai local pages for Huai Khwang, Ratchada, Rama 9, Asoke, Sukhumvit, Ladprao, Din Daeng, Chatuchak, Silom, Sathorn, and Bangna are highly templated and only lightly differentiated. Google explicitly recommends separate URLs for different language versions and uses algorithms, not `hreflang` alone, to determine page language; mixed-language or weakly localized pages can therefore underperform in regional matching. ²

For Thai rankings specifically, the site looks structurally disadvantaged in sampled SERPs. When searching Thai commercial terms around Bangkok accounting, current results prominently surface **directories and established firms** whose snippets communicate stronger differentiation such as **pricing, years of experience, DBD recognition, or CPA/registered-accountant trust signals**. In the sampled results, Pinpoint often does not appear, and when Pinpoint pages do surface, several snippets fall back to contact/footer text rather than compelling value propositions. That combination usually suppresses both **visibility** and **CTR**, especially in local service SERPs where the user intends to compare providers quickly. ³

The site's **AAIO/AEO work is directionally smart but partially misallocated**. Google's current guidance is that AI visibility in Search still rests on normal SEO fundamentals: crawlable content, indexing eligibility, clear technical structure, unique content, and useful markup. Google explicitly says you **do not need** `llms.txt`, **“special AI markup,” or content chunking** to appear in AI Overviews or AI Mode, and that overfocusing on those tactics is unnecessary. Pinpoint's “Direct answers for AI Search,” FAQ sections, official references, and entity-verification page are valuable, but the bigger win now is to strengthen **helpfulness, authority, localization, and snippet competitiveness**, especially for Thai queries. ⁴

Because I do **not** have private access to GA4, GTM, GSC, raw HTML source, or public PageSpeed Insights output for this domain in this environment, some items in this report are marked as **verified, strongly**

indicated, or unverified publicly. The highest-confidence, highest-impact next actions are to: **clean up language architecture and hreflang/canonical clusters; consolidate or radically improve local pages; rewrite top Thai service pages and snippets around real commercial intent; strengthen Google Business Profile and citation consistency; add visible local trust assets; and audit GSC/GA4 to confirm whether the country split reflects real search demand or measurement noise.** Google's own tools should be treated as the source of truth for indexing, country-level search performance, and Core Web Vitals. ⁵

Scope and site inventory

I began with the user-prioritized domain and mapped the publicly discoverable page set from the site itself and Google-indexed results. The site currently exposes a **Thai homepage**, an **English homepage**, a **services hub**, **about/resources/FAQ/contact/privacy/terms**, a **Bangkok hub**, an **entity-verification page**, at least one **core service page for company registration**, a cluster of **Bangkok neighborhood pages**, and a **blog index with roughly twenty article URLs visible from the page itself**. Public search results also reveal many English alternates exposed on `?lang=en` URLs. ⁶

The blog index is a real asset. It is not just a thin archive; it links out to multiple topic clusters around **monthly accounting, pricing, VAT readiness, payroll/social security, foreign directors/shareholders, company registration, DBD amendments, business licenses, work permits, company closure, and year-end close**. That topic depth is relevant to both organic search and AI answer surfaces because it gives Google and AI systems more evidence of topical authority and internal topical relationships. ⁷

At the same time, the publicly visible architecture shows a likely **two-speed content strategy**. One lane is aimed at **Thai local service intent** through the Bangkok hub and neighborhood pages. The other lane is aimed at **foreign-founder / English-language compliance intent** through `/en/`, the foreign-founder registration guide, and many `?lang=en` alternates. That dual strategy can work, but only if the **language, canonical, and localization implementation is extremely clean**. Public evidence here suggests it is not yet clean enough. ⁸

A note on methodology: I could verify rendered content and indexed URLs, but **I could not directly inspect raw HTML source for exact meta tags, JSON-LD, robots rules, sitemap contents, GTM container IDs, or live PageSpeed scores** in this environment. Where those items matter, I have explicitly separated what is **currently observable** from what must be verified in GSC, GA4, GTM, server logs, or direct page-source review.

Findings by dimension

Technical SEO, crawlability, schema, and international targeting

The site appears to be **crawlable and indexable at a broad level** because Google is already surfacing many URLs from the domain, including the homepage, services, FAQ, blog posts, Bangkok hub, neighborhood pages, verification page, support pages, and English content. That makes a sitewide noindex, robots block, or discovery failure **unlikely** as the main explanation for low traffic. Google notes that indexing still requires crawlability and indexable content, and indexed presence across many URLs is strong evidence that the site has passed the basic eligibility bar. ⁹

The architecture is also relatively **shallow**, which is good. The homepage links to major top-level sections, the Bangkok hub links to local pages, and the blog index exposes many articles in one click. Google's crawlability guidance favors crawlable links and clear architecture, so this is a net positive. ¹⁰

The strongest technical weakness visible from public evidence is **multilingual inconsistency**. Google recommends **different URLs for different language versions** and says `hreflang` helps it connect localized variants, but that Google still uses algorithms to determine the page language. On this site, the English homepage is a clean `/en/` URL, the foreign-founder guide is also a clean English URL, yet many other English variants are indexed as `?lang=en` parameters. Several of those indexed "English" pages still expose Thai-language snippet text in search results, which strongly suggests that localization is incomplete, not reciprocally clustered, or not canonicalized consistently. That pattern increases the risk of **index duplication, weak language disambiguation, fragmented authority, and mismatched country/language serving**. ¹¹

The second technical weakness is the **Bangkok location-page cluster**. Publicly rendered pages for Huai Khwang, Ratchada, Rama 9, Asoke, Silom, Sathorn, and Bangna all follow a near-identical template with only the area name changed and very little unique area-specific substance. Google is clear that duplicate content is not automatically a penalty, but it can waste crawl resources and force Google to choose canonicals on its own; Google also warns against scaled low-value content created mainly to manipulate rankings. These pages are not obviously spam, but in their current form they are dangerously close to **thin local intent pages** rather than high-value local landing pages. ¹²

On the AI-answer side, the site is doing several things right. The homepage has a **"Direct answers for AI search"** section and a **FAQ** block; the verification page centralizes the legal entity, phone, maps, DBD references, and canonical domain guidance; and the foreign-founder guide starts with a **short answer** and official references. Those are exactly the kinds of **answerable, citation-friendly, entity-explicit pages** that tend to work well for AI-assisted retrieval and answer generation. Google also says structured data helps Google understand content, and that generative AI search is still grounded in the main Search index. ¹³

However, the site's own copy repeatedly references **sitemap**, `llms.txt`, `ai.txt`, and **schema markup** as part of its AI-search stack. That may be strategically interesting for non-Google systems, but for Google Search specifically, Google now says you **do not need** `llms.txt`, **special AI files, or special AI markup** to appear in generative AI features. In other words, Pinpoint should keep the answer-first content mindset, but it should stop treating AI-specific files as a top growth lever and instead prioritize **canonical language architecture, better content differentiation, and stronger authority signals**. ¹⁴

Because I could not inspect raw HTML, I cannot verify the site's exact **robots.txt**, **XML sitemap contents**, **meta robots**, **canonical tags**, or **JSON-LD schema** from source. Those should be checked immediately in direct source, Search Console, and the Rich Results Test. Google's own documentation is the relevant standard here: use robots for crawl guidance, not noindex; use canonical and hreflang consistently; and test structured data with Google's tools. ¹⁵

On-page content, keyword targeting, intent matching, and localization

Topically, the site is well aligned with its business. Across the homepage, English homepage, blog, and service pages, it consistently covers **monthly accounting**, **tax filing**, **company registration**, **DBD amendments**, **VAT**, **payroll**, **social security**, **visa/work permit support**, **business licenses**, and **company dissolution**. That consistency is a real strength and gives the domain a coherent subject graph. ¹⁶

The content also shows a useful **answer-first** pattern. The homepage and blog posts give succinct explanations, include publication/review dates, and often cite official government references. The foreign-founder guide is particularly strong from an informational-intent standpoint because it combines a short answer, process detail, supporting references, and clear next-step CTAs. That kind of content is aligned with Google's current guidance for "helpful, reliable, people-first" content and with AI surfaces that need extractable passages. ¹⁷

The problem is not topical irrelevance. The problem is **intent portfolio imbalance and SERP competitiveness**. In sampled Thai commercial SERPs around "สำนักงานบัญชี กรุงเทพฯ," "รับทำบัญชี," and accounting services in Bangkok, the results prominently feature directories and competitors whose snippets communicate fast-buying cues such as **starting price**, **DBD quality recognition**, **years of experience**, or **professional accreditation**. Pinpoint's pages often either do not appear or surface with weak boilerplate snippets. This suggests that the site's **Thai commercial landing pages are not yet strong enough in exact-match demand capture, snippet appeal, or authority** to displace established Thai providers. ¹⁸

Snippet quality is an especially important bottleneck. On several indexed Pinpoint results, Google is showing **footer-heavy or contact-heavy text**, such as phone, website, address, or generic "บริการและข้อมูล," instead of persuasive service summaries. That usually happens when the page's meta description is missing, generic, duplicated, or less useful than boilerplate content on the page. In contrast, competing Thai snippets frequently show differentiated commercial information immediately. That hurts Thai CTR even if ranking improves. Since Google uses automated systems to generate snippets and title links, the solution is not just setting meta descriptions; it is making the most important, differentiating copy **high on the page, specific, and easy for Google to extract**. ¹⁹

Localization is another major issue. Multilingual SEO is not the same thing as translation. Google's multilingual guidance and industry best practice both point to the same conclusion: use separate URLs, align language versions cleanly, and do **market-specific keyword research**, not just text translation. An AAAI paper on multilingual and multi-regional query intent found measurable ranking improvements when language/region attributes are matched to user intent. That matters here because Thailand users often search in Thai, in mixed Thai-English commercial shorthand, or with local modifiers that are not interchangeable with English-language "Thailand as a foreigner" intent. Pinpoint has made a bilingual effort, but public evidence suggests the current English alternates are not yet localized as genuinely separate, polished market assets. ²⁰

One more subtle on-page issue is **trust differentiation**. Pinpoint's about page is professional but generic. It explains the working style and bilingual service, yet it does not surface named experts, visible qualifications, licensing associations, customer proof, review counts, or concrete pricing/package anchors. By contrast, competing snippets in this market often explicitly mention DBD recognition, registered accountants, CPAs, experience, or starting prices. In local B2B services, that kind of trust shorthand materially affects what gets clicked. ²¹

Off-page signals, backlinks, citations, and local SEO

Public off-page visibility appears **thin**. Outside Pinpoint's own domain, the clearest discoverable references are **DataForThai / official-style registry references, Google Maps**, several **Facebook posts or groups**, and at least one business-listing style profile. That is not nothing, but it is not a strong authority moat for a competitive Bangkok accounting market. Search engines still use authority and prominence signals, and Google Business Profile local ranking explicitly depends on **relevance, distance, and prominence**. ²²

The local SEO signal set is therefore probably underdeveloped. Pinpoint clearly understands the value of entity consistency; the site repeatedly publishes the legal company name, registration number, address, phone, and maps link, and the verification page was plainly created to reduce entity ambiguity. That is good practice. But local pack strength also depends on **review profile depth, category relevance, citation consistency across third-party directories, and broader local prominence**. Public search results do not show much evidence yet of a rich local citation ecosystem around the brand. ²³

There is also a potentially important **entity-category ambiguity** in public registry data. DataForThai's snippet shows the company with the same DBD number and Huai Khwang address, but the description surfaces a mixed classification: a broad registered-objective line around wholesale materials plus a later line indicating accounting/tax consulting activity. That kind of public-data inconsistency can confuse users and sometimes third-party directory ingestion. Even if it is legally normal, it makes it more important that Google Business Profile categories, on-site schema, directory listings, and service-page messaging are perfectly aligned around the accounting/tax service identity. ²⁴

For AAIO/AEO beyond Google, the verification page is a real asset because it creates a **citation-ready entity page** with legal name, DBD number, maps, and canonical-domain instructions. That improves machine retrievability. But Google specifically warns that "seeking inauthentic mentions" is not a durable AI-search tactic. So the right off-page strategy is **authentic prominence building**: getting more reviews, more industry mentions, more citations from relevant Thai SME/legal/accounting ecosystems, more local partnerships, and more branded references tied to the same NAP/entity facts. ²⁵

Performance, hosting, mobile UX, analytics, and conversion

I could not obtain usable public PageSpeed Insights or CrUX output for this domain in this environment, so I cannot make a verified claim about the site's current **Core Web Vitals**, server response time, CDN configuration, or specific page-speed bottlenecks. That said, Google's own guidance remains clear: page experience matters, Core Web Vitals are used by ranking systems, and speed especially matters when many pages are similarly relevant. Search Console's Core Web Vitals report should be used as the primary field-data source of truth. ²⁶

A Google/Think with Google research paper found that **bounced sessions had slower DOM-ready times than non-bounced sessions**, reinforcing that first-load speed and initial page experience affect user behavior. A broad literature review on website design and engagement similarly notes that poor website design can frustrate users and increase bounce behavior. So even without direct PSI numbers, it would be a mistake to downplay performance and UX simply because the site is content-rich. ²⁷

The site is clearly designed with mobile conversion actions in mind: the homepage and key pages repeatedly foreground **phone, LINE OA, and short contact flows**; the FAQ explicitly says users can read details, fill forms, and contact the team from mobile; and Google indexes the site with mobile-first principles. That is positive. But mobile-first indexing also means the **mobile version is the primary version Google uses for indexing and ranking**, so the mobile version must contain the same content, structured data, and internal links as desktop. ²⁸

On analytics and tracking, the privacy policy indicates that the site captures **technical form-submission details, page URL, and basic campaign data**, and that it may use service providers related to **hosting, email delivery, analytics, or databases**. So some measurement stack likely exists. Publicly, though, I could not verify the actual GA4 or GTM implementation, event naming, conversion tagging, consent setup, or channel definitions. ²⁹

That makes **measurement hygiene** a critical part of the debugging work. In GA4, Google automatically excludes known bot traffic, but Google also provides internal-traffic filters and hostname filters because polluted data still happens. If “outside Thailand” sessions are rising unusually fast while conversions lag or landing pages look implausible, the first checks should be **hostname, traffic source/medium, landing page, engagement rate, key-event rate**, and **internal/developer traffic filters**. In Search Console, the right diagnostic is to compare **Thailand vs the growing country** by **page, query, and device**, then use URL Inspection to see which URLs are actually indexed and canonicalized. ³⁰

Diagnosis of low traffic and low Thailand share

The best-supported diagnosis is that the site has **good SEO intent but weak Thai market execution**. The current content strategy is sophisticated enough to create indexable pages and AI-answer-friendly content, but the Thai side of the portfolio is not yet distinctive enough to outperform stronger local competitors, while the English and foreign-founder side is naturally more discoverable outside Thailand. ³¹

The first bottleneck is **local-page quality**. The Bangkok neighborhood pages are too similar to each other. They tell Google, in effect, “this is the same page for ten places,” which weakens both ranking confidence and user value. If those pages are kept, each must become a truly local asset with distinct proof, neighborhood-specific intent, local case examples, logistics, service constraints, travel proximity, and nearby-business relevance. Otherwise, they should be consolidated into fewer, stronger landing pages. ³²

The second bottleneck is **multilingual fragmentation**. The domain has clean English pages for some assets and parameterized English pages for others, with mixed-language snippets visible in Google. That is exactly the kind of implementation that can generate outside-country impressions while still failing to build clean localized authority. Google says separate URLs plus hreflang are the preferred model. Right now the site looks more like a hybrid of translation parameters and standalone English pages than a consistently localized information architecture. ³³

The third bottleneck is **SERP message weakness in Thailand**. Sampled Thai competitors communicate “why click me” more clearly through pricing starters, credentials, or accreditation. Pinpoint’s strongest differentiators—official references, entity verification, bilingual capability, structured onboarding—are real, but they are not yet expressed as strongly in snippets or top-of-page copy for Thai commercial pages. This likely hurts CTR even when impressions are present. 34

The fourth bottleneck is **authority and prominence**. Public references to the brand are currently too limited for a competitive local B2B service market. That matters both for organic rankings and for Google Business Profile prominence. The site has the right entity data on-site, but the broader web does not yet appear to echo that entity strongly enough. 35

The fifth bottleneck is **recency and measurement ambiguity**. Much of the visible content expansion appears recent, with key pages updated or published in June 2026 and several posts appearing in the last three months. SEO gains from a fresh content program often arrive unevenly across countries and query classes. So some outside-Thailand growth may simply reflect early traction on English informational pages, while Thai local SEO is still underperforming. At the same time, without private GSC/GA4 data, it remains possible that some of the geographic pattern is being amplified by tracking or attribution issues. 36

Prioritized fixes and current-versus-recommended settings

The table below separates what is observable now from what I recommend next.

Dimension	Current state	Recommended state	Effort	Impact
Language architecture	Mixed model: clean <code>/en/</code> and clean English guide URLs exist, but many English alternates are indexed as <code>?lang=en</code> , and some “English” results still show Thai snippet text. ³⁷	Move to one stable URL per language version for every important page. Use reciprocal <code>hreflang</code> , self-canonicals, and consistent internal links between TH and EN pairs. Remove reliance on parameterized alternates for indexable landing pages. ³⁸	Medium	Very high
Local pages	Neighborhood pages are near-duplicate templates with only minor area-name swaps. ³⁹	Consolidate into fewer, stronger local hubs unless each page can be rebuilt with unique neighborhood proof, service constraints, local testimonials, maps/logistics, nearby-business context, and unique FAQs. ⁴⁰	Medium	Very high
Snippet competitiveness	Several indexed Pinpoint results show footer/contact-heavy snippets rather than compelling service summaries. ⁴¹	Rewrite title tags, descriptions, and above-the-fold copy on top Thai commercial pages so Google can extract better snippets. Put key differentiators high on page: service scope clarity, bilingual support, Bangkok office, pricing bands, and who the service is for. ⁴²	Low	High
AAIO/AEO implementation	Good answer-first structure, FAQ blocks, official references, verification page, explicit entity details. Site also references <code>llms.txt</code> and <code>ai.txt</code> . ⁴³	Keep answer-first structure, but focus on indexability, helpfulness, and uniqueness . Treat <code>llms.txt</code> as non-core for Google; prioritize better retrieval through stronger pages, schema, and authority. ⁴⁴	Low	High
Structured data	The site text claims schema usage, but exact JSON-LD markup is not publicly verifiable here. ⁴⁵	Install and validate LocalBusiness/Organization , <code>BreadcrumbList</code> , and where appropriate <code>FAQPage</code> on pages whose FAQ content is visible to users. Use Google’s Rich Results Test and keep markup aligned with visible content. ⁴⁶	Medium	Medium

Dimension	Current state	Recommended state	Effort	Impact
Entity clarity	Excellent on-site entity proof: full legal name, DBD number, address, phone, Maps, DataForThai, DBD references. ⁴⁷	Extend the same entity facts consistently into Google Business Profile, directories, social bios, and backlinks. Add <code>sameAs</code> schema links where appropriate. ⁴⁸	Low	High
Local SEO	Google Maps/GBP is referenced, but public prominence signals appear limited relative to competitors. ⁴⁹	Optimize GBP categories, services, business description, photos, posts, Q&A, and reviews. Build citation consistency. Google's local ranking uses relevance, distance, and prominence. ⁵⁰	Medium	Very high
Trust proof	About page is professional but generic; competitor snippets often show DBD quality recognition, price points, or stronger credentials. ²¹	Add visible trust assets to top service pages: who handles the work, process steps, turnaround ranges, price bands where safe, review proof, case examples, and compliance credentials where applicable and truthful.	Low	High
Backlinks and mentions	Public mention footprint is sparse and skewed toward Facebook plus directories/registries. ⁵¹	Pursue local and industry mentions from Thai SME communities, legal/business blogs, chambers, coworking/ expat networks, startup resources, and accounting-software ecosystems.	High	High
Analytics hygiene	Privacy policy implies analytics/campaign tracking, but public GA4/GTM details are not visible. ²⁹	In GA4, verify key events, source/medium logic, internal/ developer filters, hostname filters, and lead tracking for phone clicks, LINE clicks, form starts, and form submits. ⁵²	Medium	Very high
Search debugging	Public analysis can't replace GSC truth.	In GSC, compare Thailand vs top growing foreign country by page/query/device; inspect canonical/indexation for every top landing page; use Page Indexing and CWV reports as operational dashboards. ⁵³	Low	Very high

Dimension	Current state	Recommended state	Effort	Impact
Core Web Vitals	Unverified publicly in this audit environment.	Run PSI and GSC CWV on the homepage, Bangkok hub, top Thai service pages, contact page, and high-traffic blog posts. Improve image weight, server response, CLS, and LCP where needed. Google uses CWV as part of page experience. ⁵⁴	Medium	Medium

A concise fix checklist, in priority order, looks like this:

- Rebuild language architecture so each important TH page has exactly one TH URL and exactly one EN URL, with reciprocal internal linking and hreflang. ⁵⁵
- Consolidate or fully rewrite the Bangkok area pages to eliminate near-duplicate thin-location content. ⁵⁶
- Rewrite top Thai money pages around actual query demand: รับทำบัญชีรายเดือน, สำนักงานบัญชีกรุงเทพ, รับจดทะเบียนบริษัท, บิดงบ, VAT, บริการเงินเดือน, บัญชีออนไลน์, and neighborhood modifiers only where genuinely supportable.
- Improve on-page snippet extractability: place pricing bands, office location, who it is for, timeline expectations, and trust proof high on page. ⁵⁷
- Expand local authority: GBP optimization, consistent NAP citations, real reviews, and third-party mentions. ⁵⁸
- Validate GSC/GA4 before trusting the “outside Thailand growth” story at face value. ⁵⁹

A/B tests worth running after the cleanup:

Test	Variant A	Variant B	Primary KPI
Thai service-page hero	Generic “สำนักงานบัญชี กรุงเทพ” positioning	Intent-specific hero with who it is for + price-band framing + Bangkok office + bilingual support	Organic CTR and qualified lead rate
Title/snippet test	Brand-forward title	Query-forward title with location + service + qualifier	Organic CTR in GSC
Local-page model	Current templated neighborhood pages	One stronger Bangkok hub + fewer unique district pages	TH impressions, CTR, and rankings
Conversion CTA	Phone/LINE only at top	Phone/LINE plus “Get scope + checklist in 1 business day”	Form-start and form-submit rate
Trust proof	Current general copy	Add named process owner / credentials / review proof / case example module	Conversion rate and engagement time

Test	Variant A	Variant B	Primary KPI
Pricing communication	No visible range	Banded “starting from / depends on” with scope caveat	CTR, lead quality, and close rate

Ninety-day roadmap

The roadmap below assumes no site rebuild and focuses on the highest-leverage SEO/AAIO/AEO fixes first.

Window	Priority actions	Deliverables	Expected effect
Days 1–30	Verify GSC/GA4/GTM setup; export top queries/pages/countries; inspect canonical/indexation on all key pages; decide final language URL model; inventory every <code>lang=en</code> page; audit top 10 Thai commercial pages and top 10 English pages; rewrite snippet copy on homepage, Bangkok hub, company registration, pricing article, and contact page. ⁶⁰	Tracking spec, URL map, indexation matrix, rewritten metadata/hero copy, prioritized page list	Clearer diagnosis, better CTR, fewer false signals
Days 31–60	Rebuild multilingual clusters; implement or fix <code>hreflang</code> and self-canonicals; consolidate or rewrite local pages; add validated schema; upgrade top Thai service pages with trust proof, scoped FAQs, unique differentiators, and commercial-intent CTAs; optimize GBP and standardize citations. ⁶¹	Clean TH/EN URL pairs, improved local pages, schema validation report, GBP optimization checklist, citation sheet	Better country/language matching, stronger local relevance
Days 61–90	Build authority with local and industry mentions; publish 4–6 truly differentiated Thai money pages and 2–3 English foreign-founder/compliance pages; add internal links from blog to service pages; run A/B tests on titles and hero sections; review GSC country split again; review CWV and refine. ⁶²	New service and support pages, outreach targets, test results, updated dashboard	Stronger Thai share, steadier non-TH growth, more qualified organic leads

If executed well, I would expect the **biggest early gains** to come not from exotic AI tactics but from four practical moves: **better Thai commercial landing pages, cleaner TH/EN separation, stronger GBP/citation/review signals, and improved snippet CTR**. Those are also the fixes most likely to shift the Thailand share upward. Google’s current AI-search guidance reinforces that conclusion: foundational SEO and genuinely useful content remain the main path to both classic organic visibility and AI-surface inclusion. ⁶³
